

# **HANA Spatial**

## SELF-GUIDED DEMONSTRATION

Version 1.2

September 22, 2017

#### **Demo purpose**

This script walks you through how to demonstrate the Spatial feature in SAP HANA. It is intended to give you a quick overview of how spatial data works and outlines some of the available SQL functions that can be used with this feature.

#### Using the script

The demo is presented in a four-column format. This format is designed to accommodate your time restrictions and interests. The script is meant to be followed from beginning to end.

Step	What to do	What you should see	Notes
Step number	Step by step instructions	Screen-shots of what you'll see	Details about what you are doing/seeing

### **Preparation**

This script was written for use on SAP HANA Express (HXE).

As you will be using HANA Express there is some configuration in Step P1 below that you will need to do in order to set up this system properly. This is very important if you plan to do any development on this system.

Step	What to do	What you should see		
P1	Please open and watch the video here to get started.		1)	Follow the steps from the start to 5:20 in the video.
	The title says Predictive Analysis Library but the configuration steps	≡ •YouTube <sup>ω</sup> Search Q	2)	You don't need to do the steps in 5:20 to 7:20 if you don't plan on using predictive analysis on your HXE system.
	for HXE are in this video.	SAP HANA Academy  Predictive Analysis Library	3)	From 7:20 to 8:00 you need to do as you'll want to create a connection to your HXE database as the system user on that tenant. Keep the Chrome tab open.
		Live! @TechEd 2017	4)	You don't need to watch from 8:00 on if you don't plan on using predictive analysis.

P2	Open the script on importing the spatial demo data by copying this link and pasting into a new tab in Chrome.  Copy lines 5 to 11.	https://raw.githubuserco ×	We're going to use a script based method to import a .csv file from GitHub.  Running import scripts on the HANA system can be more efficient than running imports in HANA Studio (Eclipse with HANA Tools) or via the Web ID or Web Development Workbench.
P3	Open Putty from the Windows Taskbar.  Double click on the HXE connection to connect to our HXE's Linux system.	Putty  Selection Colours Connection Data Proxy  HANA1 HXE Save  Proxy  Have a lot of fun ec2-user@ip-10-0-0-6:~>	There's already a secure connection created to your HXE system taking into account the edit (mapping) that you would have done to your Hosts file as per the video you watched and followed earlier.
P4	Paste in the syntax that you copied a couple of steps earlier.	hxehos "9.96", "551.18", "690.80", "198.90", "747.9 .51", "0.00", "1.05", "0.00", "6.66", "52.28" 1", "0.00", "286.11", "2245.95", "2050.05", " , "0.00", "0.00", "0.00", "0.00", "0.00", "285 66.06", "1044.93", "513.04", "230.97", "3949	The script that you ran has created a work directory on your Linux system, copied a .csv file from github to that directory, and previewed the first 10 lines of that file.
P5	Go back to the Chrome tab where you have the data import script open.  Copy lines 18 to 131.	######################################	In the next steps we'll use the HXE WebIDE to create our spatial demo schema, a table, and then import our .csv data into that table.

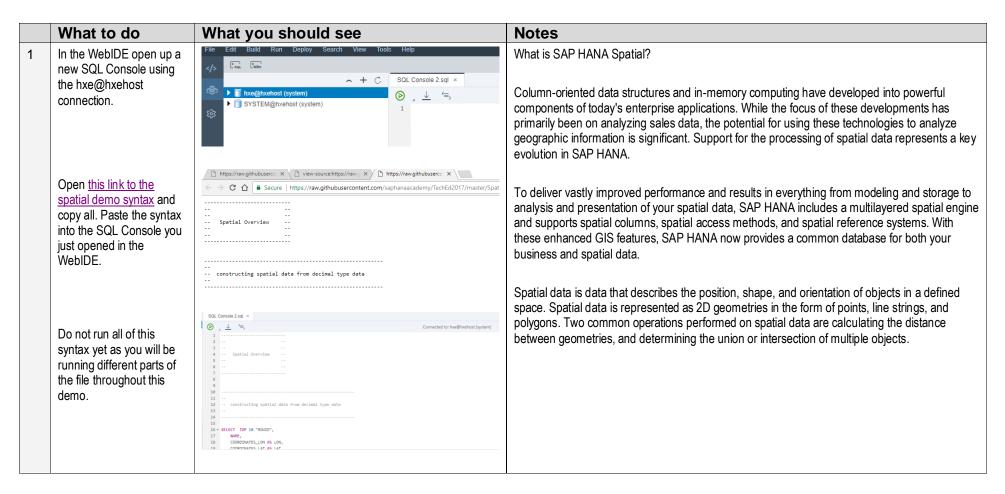

P6	You should have a tab in Chrome open from before where you created a couple of connections to your HANA system.  Click on the hxe@hxehost connection and press the Open SQL Console button.	← → C  Not secure   https://hxehost:53075/watt/index.html  Proceedings of the content of the co	If you closed your WebIDE tab click on the HXE bookmark in Chrome and then click on the WebIDE link in the lower right of your HXE landing page. Then click on the Database Explorer button on the left toolbar of the WebIDE.
P7	Paste in the code that you copied a couple of steps earlier.	SQL Console 1.sql ×	You have created a new schema in your HXE db and then a new table and then imported the census data from the .csv file into that table.
	Click on the Run button.	104 ); 105 106 - IMPORT FROM CSV FILE '/usr/sap/HXE/HD890/work/shadata/censusdata.csv' 107 INTO "SPATIAL_DEMO"."CENSUS" 108 WITH 109 RECORD DELIMITED BY '\n'	You should also see a top 10 record set returned from that new table. Close this SQL Console (but don't close the WebIDE) as the preparation steps are not yet complete.
P8	Open the data schema prep file here	SOL Console 2 sql ×  Sol Connected to: hxe@hxehost (system)  Connected to: hxe@hxehost (system)	We're creating another table and adding some coordinate data into that table.
	and copy the syntax.  Open another SQL Console and paste in the syntax.  Highlight and then run lines 14 to 26.	14 - PRETER COLUMN TABLE SPATIAL_OBMO.CENSUS_BINARY ( 15 "ROGID" INTEGER CS_DNT, 16 NAME WARCHMA(100), 17 LOUILAT_BINARY BLOB REMORY THRESHOLD 1000 18 UNLOAD PRICENTS SOUTO RENGE; 19 20 INSERT INTO SPATIAL_DEMO.CENSUS_BINARY ( 21 SELECT TOP 10 "ROWID", 22 NAME, 23 HEN ST_POINT(CORODINATES_LON, CORDINATES_LAT).ST_ASBINARY() 24 FROM SPATIAL_DEMO.CENSUS 25 ORDER BY "ROWID" ASC 26 ); 27 28 29 the following statements_should_only_be_run_if_vou_wont_to_c]ggg_out_vour_system_and_ceneat_the_demo.meain_ Messagge x  Statement "CREATE COLUMN TABLE SPATIAL_DEMO.CENSUS_BINARY ( "ROWID" INTEGER CS_INT, NAME VARCHAR(100),"	In this case though we're transforming the data into binary data using the spatial function .ST_AsBinary. The reason we're doing this is to mimic a common storage method for coordinate data. Note that this is not the recommended way to store data in HANA if you're using spatial features on that data.  We'll be showing later how to convert binary coordinate data into proper spatial type data.
		executed in 7 ms. Statement "INSERT INTO SPAITAL_DEMO.CENSUS_EINARY ( SELECT TOP 10 "ROWID", NAME, NEW' executed in 9 ms - Rows Affected: 10	You are now done the preparation steps.

## Step-by-step live demo script

It is imperative that you have already completed all of the steps in the previous Preparation section.

	What to do	What you should see	Notes
2	Select and run lines 16 to 22.	D  14  15  16 SELECT TOP 10 "ROWID",  17 NAME,  18 COORDINATES_LON AS LON,  19 COORDINATES_LAT AS LAT,  20 NEW ST_POINT(COORDINATES_LON, COORDINATES_LAT) AS LON_LAT_POINT  FROM SPATIAL_DEMO.CENSUS  22 ORDER BY "ROWID" ASC;	This syntax shows how to construct a spatial point type (ST_POINT) in SAP HANA SQL.  The LON and LAT coordinate columns in this particular case are stored as Decimal types in this CENSUS table. To get started using Spatial in HANA you can simply:  a) Create a table that contains a Spatial Type column (ST_POINT or ST_GEOMETRY) or  b) You can use extended SQL functions against existing data, like in this example.
		Result   Messages   Rows (10)	The raw output of the point we've constructed (LON_LAT_POINT) is in binary format. Later on we'll look at methods to make the output more readable. Option (a) above is recommended for performance reasons.
3	Select and run lines 31 to 44.	TREATE COLUMN TABLE SPATIAL_DEMO.CENSUS_GEO  LIKE SPATIAL_DEMO.CENSUS WITH NO DATA;  33  34 ALTER TABLE SPATIAL_DEMO.CENSUS_GEO ADD ( LONLAT_POINT_0 ST_GEOMETRY(0)  36  37  38 ALTER TABLE SPATIAL_DEMO.CENSUS_GEO ADD ( LONLAT_POINT_1000004326 ST_GEOMETRY(1000004326)  40  );  41  42 ALTER TABLE SPATIAL_DEMO.CENSUS_GEO ADD ( LONLAT_POINT_4326 ST_GEOMETRY(4326)  43  LONLAT_POINT_4326 ST_GEOMETRY(4326)  44  );	We're creating a copy of the CENSUS table, without data, and then adding 3 different Spatial Type (ST_GEOMETRY) columns to the new table.  The purpose of this and the next couple of steps is to show how to create a new table or alter an existing table to include a Spatial Type column. While this is not 100% necessary, as you can construct Spatial data on the fly like in Step 2 above, this will make the creation of SQL queries, views, and web services a lot easier and lead to better performance. Having your data stored as spatial type data is the recommended option.  Three main spatial systems for storing data in HANA are:  1) The default which is a Cartesian system (SRID 0), 2) WGS 84 Planar (SRID 1000004326) which is a flat projected system (e.g. a map), and 3) WGS 84 (SRID 4326) which is the spheroidal system used for GPS.  Each system has different advantages (and use cases) which we'll also look at later on. Please see the Spatial Reference Guide for more information on these different systems.

	What to do	What you should see	Notes
4	Select and run lines 50 to 58.	48 - INSERT INTO SPATIAL_DEMO.CENSUS_GEO ( 49	Using existing longitude and latitude columns (stored as Decimal or Float type data) to create a new ST_GEOMETRY or ST_POINT column is relatively easy as it simply requires constructing a NEW ST_Point() like we used earlier in Step 2.  This means that any table brought into HANA that contains longitude and latitude columns can be easily altered to contain a spatial column and existing data can be transformed and inserted into those new spatial columns, like in our example here.
		□ 2 61911 mu acs_topline 06037262701 Census Tract 2627.01, L	Note that the order of the two dimensions in the constructor is longitude and then latitude which corresponds to an X and then a Y dimension. Some other databases and some mapping tools use the order of latitude and then longitude.
5	Select and run lines 67 to 75.	1   134   187   18945712   34.7893501   010100000000006EF373   01010000000006EF373   010100	The 3 new ST_Geometry columns in our new table are returned by default in a binary format. The binary output of the 3 columns is identical as, even though these points are stored in different Spatial Reference Systems, the underlying point data remains unchanged.  Earlier we created these 3 new columns as ST_Geometry Type columns. We could have also created ST_Point Type columns as we know in this case that these columns will only contain point (longitude and latitude) data.  ST_Geometry is the super-type for all geometries and includes points, polygons, line-strings etc. We'll look at these sub-types later on.
6	Select and run lines 79 to 90.	77 viewing spatial type data using various representation methods 78 79	This query contains several methods of changing the output of our geometry columns. Two of the more readable methods are AsWKT() or 'As Well Known Text' and AsEWKT() or as 'Extended Well Known Text'.  There is also a geo-JSON output that can be consumed in web applications as well as an SVG output.

	What to do	What you should see	Notes
7	Select and run line 99.	SELECT * FROM GEO_SPATIAL.CENSUS_BINARY	Spatial data may exist as point data stored in binary format in a table. Earlier in the preparation steps we created a table that data stored this way.  You will want to convert these types of columns into a Spatial Type column so that it is easier to
		4       1,973       Census Tract 9, Coconino County, Arizona         5       1,974       Census Tract 14, Coconino County, Arizona         6       1,975       Census Tract 9411, Coconino County, Ari         7       1,976       Census Tract 1, Gila County, Arizona         8       1,977       Census Tract 5, Gila County, Arizona         9       1,978       Census Tract 10, Gila County, Arizona         10       1,979       Census Tract 9402, Gila County, Arizona	use the converted data in SQL queries etc. This is also recommended for performance reasons.  We'll alter this table to have new HANA Spatial data type columns in the next step.
8	Select and run lines 103 to 115.	Connected to hee@heehost (bystem)    Main	In this step we've altered the table with a binary to include a true ST_Point type column. Note that spatial type columns can be either ST_Geometry or ST_Point.  We then converted the existing binary column using this syntax:
111 SELECT NEW ST. POLYTO (DESPOND) FROM C 112 MARKE CROUDS_ELBARY_ROALD* - C.*ROALD* 113 ); 114 115 SELECT **, LOWLAT_POINT.ST_ASSATI() FROM SPATIAL_DEVO.CHOUSE_ELBARY; 116 117 118 119		112 SMERK CHROUT, BILMAY, "ROUD" - C. "ROUD"  113 ); 114 115 SELECT *, LONGAT_POINT.ST_ASMIT() FROM SPATIAL_DEPO.CERSUS_BILMAN; 116 117 118 119 119 119 119 119 119 119	ST_GeomFromWKB(LONLAT_BINARY)  This conversion method output is then inserted into the new ST_Point column. We've now
		Rever (10)	converted a table that had a binary column to a table with a HANA Spatial column.

What to do What you should see **Notes** Select and run lines 155 to In this set of gueries we'll look at the performance of each of the 3 systems we've been using by 10 208. calculating the number of geographical points within a pre-determined polygon. 154 -- st within & srid 0 155 - SELECT 156 SUM(POPULATION\_TOTAL) AS POP, We're using 3 different methods for the calculation: ST Within, ST Contains, & ST CoveredBy. COUNT(\*) AS POINTS 157 158 FROM SPATIAL\_DEMO.CENSUS\_GEO ST Within is equivalent to ST Contains in that all geometries must be completely within the 159 WHERE LENGTH(CENSUS GEO ID) = 11 interior & not intersect the boundary. Neither of these two can be used in round earth (SRID 160 - AND LONLAT\_POINT\_0.ST\_Within(NEW ST\_Polygon('Polygon(( 4326) calculations. There are other methods that cannot be used with the 4326 system. However, we've seen with SRS 0, for obvious reasons, that the distance calculations are not accurate for LON LAT points. NOTE: The differences and results of the calculations are not unique to SAP HANA as they are typical of the spatial systems used. In the next steps we'll see how to effectively deal with having best performance, the greatest accuracy for distance calculations, as well as the greatest accuracy for other methods such as ST Within.

	What to do	What you should see	Notes
11	Select and run lines 219 to 228.	218 219 - SELECT TOP 10 220	Prior to SPS10 of SAP HANA there was no method to convert data between two different Spatial Reference Systems (SRS). In theory this would mean that data would have to be stored in several different columns, each with a different SRS. The CENSUS_GEO table that we created had such a structure. However, this meant taking up extra database storage for what is essentially the same underlying data.  New to SPS10 of HANA is the ST_Transform method that allows data to be converted between different SRS and thus eliminate the need to have multiple columns of the same geometry with different SRS.  This is not a recommended complete solution though for performance reasons and should be used sparingly. The recommended solution would be to store the data in the appropriate system type where you can take advantage of HANA Spatial performance.  In this syntax we've converted data that is stored in WGS 84 Planar (flat earth) / 1000004326 to WGS 84 Spheroid / 4326. This is done on the fly / in the result set only and does not alter the data stored in HANA.
		Result × Messages × Rows (10)

		2 373 1000004326	

	What to do	What y	ou should se	ее		Notes
12	Uncomment lines 223 to 225 only. Select and rerun lines 219 to 228.	219 - SELECT 220 "RO 221 LON 222 LON 223 - ,LO 224 225 ) A 226, 227 FROM SP 228 ORDER B 229 230 what 231 232 SELECT 233	TOP 10  WID", LAT_POINT_1000004326.S' LAT_POINT_1000004326.S' NLAT_POINT_1000004326.S' NEW ST_Point('POINT(-: S DIST_TO_VAN LONLAT_POINT_0.ST_Trans ATIAL_DEMO.CENSUS_GEO Y "ROWID" ASC; spatial systems are as	T_SRID() AS SRID, T_Transform(4326).ST_Si ST_Transform(4326).ST_E 123.1208974 49.2766576)	DISTANCE( )', 4326), 'kil ey work togethe	In lines 223 to 225 we're transforming data that is stored in WGS 84 Planar so that it is in WGS 84 Spheroid. We then use this transformed data in a distance calculation with the SAP Vancouver office. The Vancouver office data is already constructed as WGS 84 Spheroid / 4326.  We can see how we can store data as WGS Planar and then use the ST_Transform method so that accurate distances can be calculated when the points are transformed in HANA SQL to WGS Spheroid.  By storing the data in WGS Planar we are then utilizing the SRS that has the best performance as well as having access to the most spatial methods / Spatial SQL functions. As mentioned earlier this should not be a complete solution as using the transform function should be done sparingly.
13	Uncomment line 226 and rerun lines 219 to 228.	"BOWID"		**************************************	In line 225 we're trying to transform a geometry stored in SRS 0 / Cartesian to SRS 4326. However an error is returned. In the next step we'll find out why.	

	What to do What you should see			Notes
14	Select and run line 232.	run line 232.  SELECT TRANSFORM_DEFINITION, SRS_ID FROM ST_SPATIAL_REFE		There are two main rules to keep in mind when using ST_Transform.
				The first rule is that the SRS must exist in your HANA system. The query that we just ran shows that we have 4 systems including the ones we've been using: 0, 4326, & 1000004326.
		t × Messages ×		The second rule is that the original system and the target system must have the same datum. If you look at the TRANSFORM_DEFINITION you'll see that the 4326 and the planar system are
		AB TRANSFORM_DE	12 SRS_ID	both WGS84 for the datum.
		1	0	SRS 0 does not have a TRANSFORM_DEFINITION and therefore one cannot transform between 0 & 4326 or 0 & 1000004326.
		2 +proj=longlat +ellps=WG	4326	
		3 +proj=longlat +ellps=WG	1000004326	Given the inability to transform from SRS 0 to other systems and vice versa, storing Spatial data in SRS 1000004326 remains the best option.
		4	2147483646	·
				However, you may encounter existing data that is already stored as SRS 0. In these cases if you require accurate distance calculations then altering that table to include a duplicate of the geometry data but in SRS 1000004326 may be the best solution.
15	Select and run lines 243 to 298.	290 291 geometry collection 292 * INSERT INTO SPATIAL_DEMO.GEOTYPES VALUE 293 New ST_GeometryCollection( 'Geometr' 294 ); 295	ES ( ryCollection (LineString(5 10, 10 12,	We've created a new table that has an ST_Geometry type column. This column, named "SHAPE", must the ST_Geometry type as opposed to a point (ST_POINT) column as later we inserted a bunch of records using different geometry types.
		296 * SELECT *, 297 SHAPE.ST_ASHKT() AS SHAPE 298 FROM SPATIAL_DEMO.GEOTYPES; 299 300 polygon with issues 301 * INSERT INTO SPATIAL_DEMO.GEOTYPES VALUES ( 302 NEW ST_Polygon('Polygon ((-5 -5, 5 -5, 0 5, -6 -6))') 303 ); 304		Once again we're using the ST_AsWKT() method to return a readable output for the SHAPE column.
				Go back to the SQL in those lines and look at the different constructors for these different geometry types.

16	Select and run lines 301 to 303.	300 polygon with issues 301 - INSERT INTO SPATIAL_DEMO.GEOTYPES VALUES ( 302 NEW ST_Polygon('Polygon ((-5 -5, 5 -5, 0 5, -6 -6))') 303 );  Messages ×  Could not execute 'INSERT INTO SPATIAL_DEMO.GEOTYPES VALUES ( NEW ST_Polygon('Polygon') for the second of the seco	We're trying to insert another polygon type but an error is returned. Given the error, what is the issue with this syntax?  A polygon (ring) must be closed. To close a polygon the syntax must go back to the starting point of the ring. I.e. in this case the constructor must be as follows where the final point is the same as the starting point of "-5 -5".  NEW ST_Polygon('Polygon ((-5 -5, 5 -5, 0 5, -6 -6, -5 -5))')
17	Select and run lines 314 to 345.	NEW ST_POINT()  333  334 NEW ST_LINESTRING('LINESTRING ZM(3 3 4 2500, 5 4 2 2600, 6 3 36 );  337 NINSERT INTO SPATIAL_DEMO.GEOMULTIDIM VALUES(  NEW ST_LINESTRING()  338  339  339  340 NEW ST_LINESTRING()  341  342  342  343 NESERT INTO SPATIAL_DEMO.GEOMULTIDIM VALUES(  NEW ST_POLYGON('POLYGON ZM((6 7 4 1800, 10 3 4 1850, 10 10 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4	New for SPS10 of HANA 1 was support for multi-dimensional data. Multi-dimensional data allows one to store an additional Z dimension in geometries. A measure, M, can also be stored.  The Z dimension does not necessarily have to be a spatial dimension as it can be used for storing other measures such as time.  Note that the spatial column is created as ST_Geometry which is a requirement for multi-dimensional data.  In the constructors for the new geometries:  - lines 319 to 321 is the 2 dimensional method  - lines 322 to 324 is a constructor for adding a third dimension  - lines 325 to 327 is a constructor for adding a measure  - lines 328 to 330 adds both a third dimension and a measure  This shows us that multi-dimensional data can be mixed with two-dimensional data.  We've looked at spatial types point, line, string, and polygon. Other Supported Spatial Types for Multi-Dimensional Data are: ST_MultiPoint, ST_MultiLineString, ST_MultiPolygon, and ST_GeometryCollection  The only geometry type that is not supported (as of SPS10 of HANA 1) is circular string.

	What to do	What you should see			Notes
18	Select and run lines 359 to 357.    349		There are several other methods that accompany multi-dimensional data. ST_ZMax as an example will return the maximum Z value of a geometrynote that this is not an aggregate function as it's a row-cell level function.  When ZMax is used on a 3-dimensional point it returns the single Z valuethe same as ZMin. When these functions are used on 2-dimensional geometries, a NULL / ? is returned.		
		Rows (9)

The ST_Z method can only be used with geometries that have a Z dimension or value.  If you were to put the comment back in line 351, uncomment line 354, and rerun the query you would get a similar error. The ST_M method can only be used with geometries that have a measure value.  In the next step we will see how to avoid these errors.
20	Select and run lines 361 to 372.	361 - SELECT ID, 362 GEO.5T_ASIMIT(), 363 CASE GEO.5T_ASIMIT(), 364 - WHEN 1 THEN GEO.5T_Z() 365 END, 366 CASE GEO.5T_ASIMEN () 367 - WHEN 1 THEN GEO.5T_M() 368 END 369 FROM SATIAL DEPO.GEOWLITIDIN 370 WHERE GEO.5T_GEOWLITIDIN 371 AND (GEO.5T_ISHO) - 1 372 OR GEO.5T_LENGERSURED() - 1);  Result × Messages ×  Rows (3)  12 ID ## GEO.ST_ASWKT()  1 2 POINT Z (5 6 8)  2 3 POINT M (56 1400)	12 CASEGEO.ST_IS 12 CASEGEO.ST_IS 8 NULL 1400	a	Another set of functions for multi-dimensional data are the ST_IsMeasured function and the ST_Is3D function. These are Boolean functions which return a 1 or a 0.  In this query we want to bring back only records which have a measure or are 3d. Here we use case statements that utilize the aforementioned functions to return a measure or 3 <sup>rd</sup> dimension when applicable or a NULL / ? value when those values are not applicable.  Another method to avoid the error in the previous step is to use only the max or min functions (e.g. ST_ZMax) as opposed to using the ST_Z or ST_M functions.
